1. Overview

Type the SIRET, Belgian enterprise number or KvK number on a contact and click Autofill. The number is checked first (Luhn for SIRET and SIREN, modulo 97 for KBO, eight digits for KvK); the module then calls the registry with your own API key (INSEE Sirene, recherche-entreprises, KBO, KvK) or reads a registry answer you paste, shows the name and address it found, refuses an answer about another company, and writes the fields you allow on the contact.

2. Features

- **Check digits first.** SIRET and SIREN are checked with the Luhn algorithm, the Belgian enterprise number with modulo 97 and the KvK number for its eight digits before any lookup. An invalid number is refused with its type named.
- **Your own registry key.** Providers for INSEE Sirene, recherche-entreprises.api.gouv.fr, KBO Open Data and the KvK API ship as templates. The API key is yours, stored in a field only administrators can read, and sent with the scheme you choose (bearer, header or query parameter).
- **Paste instead of calling.** Without a provider, paste the JSON answer of the registry in the wizard: the same parser reads it, so a lookup works without any outgoing call from Odoo.
- **Preview, then apply.** Preview shows the name, street, postcode and city found. Apply writes them on the contact, only on empty fields unless you tick Overwrite (per lookup or as a company default).
- **Wrong company refused.** When the registry answers for another number than the one asked (a full-text search returns its best hit), nothing is applied and the reason is shown.
- **Lookup log.** Every applied lookup is logged with country, number, result, number of fields applied, contact and user, and the log can be exported as CSV.

3. Installation

Open Apps, search for “FR Adresse + SIRET” (technical name fr_adresse_siret_kbo_kvk_autofill) and install it. Required modules: base, contacts. Available for Odoo 18.0, 19.0 and 20.0.

4. Workflow

1. Under Registry Autofill > Providers (BYOK) open the template of your country (INSEE Sirene, recherche-entreprises, KBO Open Data or KvK API), enter your own API key and the authentication scheme, and mark it as default for the country. Only an administrator can read the key.

2. Optionally choose the default provider per country and whether lookups overwrite existing fields in the company settings.

3. On a contact enter the registry number next to the VAT number. The number type and its validity are shown.

4. Click Autofill. In the wizard check the country and number; without a provider, paste the JSON answer of the registry.

5. Click Preview to see name, street, postcode and city, then Apply. The contact is updated and the lookup is logged under Registry Autofill > Lookup Log.

5. Roles and access rights

Every internal user can run the autofill and read the log; providers and API keys are kept by administrators.

6. Frequently asked questions

Does the module include a registry subscription?

No. You use your own registry account and key; without one you can paste the registry answer.

Are existing contact details overwritten?

Only when Overwrite is ticked in the wizard or set as the company default; otherwise only empty fields are filled.

7. Support
